My first feature is the fade-in css animation for some of the elements in the first view, the main page. I created this feature to give the loading a little bit more of a smooth transition instead of just displaying the harsh images all at once. My second feature is the use of pseudo-selectors in each view for the main, about, experience text buttons by making use of underlining or changing the font size and color. The pseudo-selector was also used for the option of opening my resume. My final feature is using javascript to have the page scroll into the respective view when you click on the navigation text buttons.
